Does Land Inequality Magnify Climate Change Effects? Evidence from France

Ignacio Flores (CUNY and PSE) and Dylan Glover (INSEAD)

March 27, 2023 Graduate Center Stone center seminar

Flores and Glover (2023)

Inequality and Climate Change

March 2023 1 / 37

Harvesting the consequences of climate change

Note. Farmer holding his head on overheated field. No farmers were harmed. Al-image from Stable Diffusion

o Heatwaves threaten global food security and price-stability

Flores and Glover (2023)

Inequality and Climate Change

The bigger question

Can we improve the resilience of our agricultural systems facing climate change?

A story of land inequality and crop diversity

Our contribution

- o We show at canton level, in France
 - + land inequality ightarrow crop diversity
 - Low crop diversity causes lower resilience to heat shocks
- o We uncover a trade-off for farmers and policy makers
 - Concentrated systems: more productive but fragile
 - Diverse systems: less productive but resilient

A story of land inequality and crop diversity

Our contribution (continued)

- o We model agricultural production partially
 - Demonstrating rational incentives to land consolidation in a supply function with economies of scale and crop-specific costs
 - In reality, concentration increases in many countries
- o Take away resilience can be improved
 - Resiliency is not a deterministic effect of land distribution, but its byproduct, given current industrial organization.
 - Resiliency can be improved by farmers individually by diversifying their production.

Related literature

Climate change on agriculture

- Negative impacts on productivity: extreme weather events (Lobell and Field, 2007; Schlenker and Roberts, 2009).
 Compound shocks (Haqiqi et al., 2021). Overall production (Dell, Jones, and Olken, 2012)
- Positive impacts on productivity: the CO_2 fertilisation effect (Taylor and Schlenker, 2021)
- Long term predictions and technological adaptantions: Predictions (Mendelsohn, Nordhaus, and Shaw, 1994; Schlenker, Michael Hanemann, and Fisher, 2005; Burke and Emerick, 2016).
- o Techonolgical adaptations (Moscona and Sastry, 2022)

Others on Inequality/Biodiversity and productivity

Data and definitions

Image: A match the second s

Measurements from the sky: in orbit since 2000

Flores and Glover (2023)

Inequality and Climate Change

March 2023 7 / 37

Measurements from the sky: main variables

Gross Primary Productivity (GPP)

- o Measures the growth of biomass every 8-days in $C.kg/m^2$
- o Based on fluorescence from photosynthesis
- o Resolution: 0.5km pixels
- o Credits to Running and Zhao (2019)

Surface temperatures

- o Monthly averages in ${}^{\underline{o}}C$
- o Resolution: 5.6km pixels
- o Credits to Wan, Hook, and Hulley (2021)

Measurements from the sky: plant productivity

Figure: 8-days cumulative GPP at 500m resolution, mid-summer 2021

Image: Image:

Flores and Glover (2023)

March 2023 9 / 37

Can we convert GPP into yield?

Possible in theory, but not enough information at our scale

Table: GPP to Yield conversion factors, examples

Crop	Factor		
Alfalfa	0.55		
Barley	0.42		
Maize	0.44		
Durum wheat	0.22		
Peas	0.28		
Spring wheat	0.24		
Winter wheat	0.35		

Notes. By He et al. (2018) for annual yield of staple crops in Montana, USA

Values are proportional to yield and we can control by composition

Measurements from the sky: temperatures (${}^{\circ}C$)

Figure: Monthly average temperature, at 5.6km resolution, summer 2021

Flores and Glover (2023)

March 2023 11 / 37

Temperature shocks

∃ ⊳

Image: A match the second s

æ

Temperature and productivity: non-linearity

- More light is beneficial for plants in normal times (photosynthesis), but there are limits
- o Schlenker and Roberts, 2009 find a nonlinear relation with crop-dependent turning points: corn ($29^{\circ}C$), soybean ($30^{\circ}C$) and cotton ($32^{\circ}C$) in the US.

Temperature and productivity: France

Figure: Monthly productivity vs. temperature (2000-2021)

Notes. Binned scatter plot in centiles of observations, no controls. Using Running and Zhao, 2019, Wan, Hook, and Hulley, 2021, and French cantons

Defining a threshold for shocks

- o We would ideally use crop-specific thresholds.
- For now, we define a single value where average productivity sharply decreases
- o We define shocks as

 $t > 30^{\circ}C$

o 7.1% of observations (avg. 0.85 times per year)

Year-long consequences of temperature shocks

Figure: Normal vs. shock years (2000-2021)

4 3 4 3 4 3 4

Measurements from the land

э

Measurements from the land

Figure: Snapshot of cadastral data

(a) The farm level (2010-2021) (b) The crop level (2015-2021)

We divide information in \approx 4000 cantons

Flores and Glover (2023)

Measurements from the land: main variables

Cantonal Land Inequality:

- o Uses georeferenced information on farm borders
- o Farm level \neq owner level

Cantonal crop diversity:

- o Data on crop-mixes within farm borders
- o Crop level, independent of ownership
- o Broader categories (28) or detailed (+150)

...which are highly correlated (-)

Figure: Diversity vs. Gini (Binned scatterplot)

Notes. Own estimates based on French Cadastral data. Cantons with less than 10% of agricultural area are ignored

Flores and Glover (2023)

Inequality and Climate Change

March 2023 20 / 37

Two faces of the same coin?

- o Rational incentives towards specialisation and land consolidation
- Plants do not farm themselves: land distribution is the political economy of the problem
- Biodiversity has a well studied causal effect on resilience of natural and experimental ecosystems

Weather shock specification

• Effect of extreme weather shock with leads and lags to account for correlation in temperatures over months

$$ln(GPP_{ct}) = \gamma_c + \lambda_t + \sum_{\tau=0}^{3} \beta_{-\tau} \times D_{c,t-\tau} + \sum_{\tau=1}^{3} \beta_{\tau} \times D_{s,t+\tau} + \epsilon_{c,t}$$
(1)

- $D_{c,t} = 1$ if there is a temperature shock in canton c in month t
- γ_c, λ_t canton and time fixed effects
- Compare impact over quantiles of land Gini and crop diversity

Heterogeneous impacts on monthly productivity

Figure: What cantons suffer more losses?

March 2023 23 / 37

・ 何 ト ・ ヨ ト ・ ヨ ト

.. what about yearly cumulative production?

Figure: What cantons perform better under heat shocks?

Robustness checks and discussion

What we have done:

- o Drop everything that is not food (\approx 40% sample)
- o Several shock-thresholds (25, 27, 33, and 35 Celsius)
- Other definitions of diversity (Hirschman-Herfindahl index) and inequality (coefficient of variation, s.d. of logs)

Steps forward and further questions:

- o Weighted shocks
- o Finer temperature data
- o What particular crop-mixes perform better?
- o Is this a portfolio effect or a symbiotic one?

Conclusions

- Economic incentives lead to more land concentration and less diversity
- Once resiliency effects are taken into account, the new optimum depends on risk aversion
- o This is a trade-off that some farmers have already started using
- o The problem lies in the extremes
